## COSC1076 | Semester 1 2020 | Advanced Programming Techniques

## Revision Questions | Week 01

These are self-revision questions, to help you track if you are understanding the weekly course content.

You should FIRST answer these questions using "pen-and-paper". Only after this should you test your answers by writing and compiling programs.

- 1. Write the minimum (smallest) C++ program that will compile and execute.
- 2. What value should the main function return?
- 3. What is the standard compilation command that will be used for this course?
- 4. What will be the final value of each variable in the following code snippet?

```
int x = 2;
double y = 10.5;
double z = 0;

x = x^2 + x * y - x;
z = x / 4;
y = z / 2;
```

- 5. What is the end-of-file character? How do you check for it when reading from standard input?
- 6. Using the following program:

- (a) Re-write the program, as if the C++ pre-processor has been run and all #define directives have been processed.
- (b) The program contains a syntax error. Identify and fix the error.
- (c) The program contains a potential error. Identify this problem and suggest a fix.
- (d) What will be the output of the program, after you have fixed the error(s)?
- 7. Is the std::string a built-in C++ type. or a STL class?
- 8. What are the significant differences between how 1D arrays are used in C++ when compared to Java?
- 9. In C++, how can you find the dimensions of an array?
- 10. Describe the process for parameter passing in C++ functions.

11. What will be the output of the following program?

```
#include <iostream>
int foo(int x);
int main (void) {
   int x = 2;
   int y = foo(x);
   std::cout << "x = " << x << ", y = " << y << std::endl;
   return 0;
}
int foo(int x) {
   ++x;
   return x*2;
}</pre>
```

- 12. Which header file(s) need to be included to access the following entities?
  - (a) std::cout
  - (b) std::string
  - (c) std::endl
- 13. Why is bad-style to use the following namespace include?

```
using namespace std;
```
